

Cloud Range

ANONYMOUS AND SECURE

The other hunter cannot see the communication between devices and does not record any data about the dog or its owner.

POWER OF THE COMMUNITY

The more DOG GPS X40 devices are out in the field, the greater the chance of quickly finding a lost dog.

Signal between the controller and the collar interrupted - the dog is behind a terrain obstacle.

1.

The signal from the dog's collar is automatically detected by the nearest DOG GPS X40 controller, without sharing any additional data.

2.

The dog's current position is sent anonymously and securely to the cloud via the mobile network.

3.

The cloud then sends the dog's position in real time to the owner's mobile app.

The Cloud Range function between devices works only if the DOG GPS X40 controller is connected to the mobile app and the phone has mobile data enabled.
